## 1. Solar Panels at the building roof

A building community is thinking of installing solar panels on the roof of the building to reduce the cost of the building's electricity consumption. The roof has $10 \mathrm{~m}^{2}$ useful to place solar panels. In table1, the average hourly consumption of the community in the two semesters of the year (365 days).

| Wh | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 | 22 | 23 | 24 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Semester 1 | 155 | 133 | 131 | 130 | 132 | 134 | 130 | 201 | 314 | 225 | 240 | 322 | 693 | 689 | 677 | 662 | 659 | 682 | 685 | 714 | 668 | 690 | 316 | 208 |
| Semester 2 | 168 | 127 | 119 | 122 | 119 | 121 | 124 | 174 | 249 | 216 | 241 | 240 | 273 | 269 | 279 | 239 | 220 | 241 | 244 | 279 | 291 | 295 | 271 | 213 |

There are three technologies with different peak generation capacity per m 2 . Thus, Thin-Film has a capacity of $200 \mathrm{~W} / \mathrm{m}^{2}$, Crystalline $250 \mathrm{~W} / \mathrm{m}^{2}$, and Multijunction $300 \mathrm{~W} / \mathrm{m}^{2}$. The installation company has sent the following offers with different annual costs for each technology and power. Any intermediate power between the values provided will have a proportional cost in each power range.

| Peak Power | Thin-Film | Crystalline | Multijunction |
| :---: | :---: | :---: | :---: |
| 1 kW | $110 €$ | $150 €$ | $200 €$ |
| 2 kW | $200 €$ | $280 €$ | $390 €$ |
| 3 kW | $280 €$ | $400 €$ | $570 €$ |

Table2 - Annual cost per technology and installed power
Next, the average solar production in Wh per hour and installed kW for each technology and semester.

| Semester 1 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Thin-Film | 50 | 100 | 150 | 200 | 225 | 200 | 150 | 100 | 50 |
| Crystalline | 60 | 125 | 175 | 250 | 275 | 225 | 175 | 125 | 60 |
| Multijunction | 75 | 150 | 200 | 300 | 325 | 250 | 200 | 150 | 75 |
| Table3 - Wh per hour of semester 1 |  |  |  |  |  |  |  |  |  |

| Semester 2 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Thin-Film | 75 | 125 | 200 | 300 | 375 | 350 | 350 | 300 | 300 | 250 | 150 | 75 |
| Crystalline | 100 | 175 | 250 | 350 | 400 | 400 | 400 | 350 | 300 | 275 | 225 | 100 |
| Multijunction | 110 | 200 | 275 | 400 | 425 | 425 | 425 | 400 | 300 | 300 | 225 | 100 |

Table4 - Wh per hour of semester 2
The community has contracted an hourly energy price in $\mathrm{c} € / \mathrm{kWh}$ as indicated below:

| Hour | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 | 22 | 23 | 24 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{c} € / \mathrm{kWh}$ | 25 | 24 | 23 | 20 | 19 | 22 | 29 | 30 | 35 | 30 | 20 | 20 | 20 | 25 | 25 | 25 | 30 | 35 | 35 | 40 | 45 | 40 | 35 | 30 |

Assume that the excess of solar production that is spilled into the grid does not generate benefits for the Community. Answer the following questions after modeling and solving a mathematical programming model:
a) Is it profitable to install solar panels? In this case, what technology and capacity of the installation should be chosen by the Community, and what would be the benefit obtained?
b) Suppose that the excess energy that is spilled to the grid is paid $19 \mathrm{c} € / \mathrm{kWh}$ to the Building Community. Does it change the previous decisions of a)? How and why?
c) In addition to question b), the Community wants to install two out of the three possible technologies. Each technology must not exceed $70 \%$ of the total installed capacity. How does the final decision change?
d) Assuming the grid payment of b) but not the condition of c) evaluate the possibility of installing a battery with a capacity of 1000 Wh to store the surplus of the energy not consumed or energy bought from the grid. What would be the annual cost that the Community would be willing to pay for this battery? Suppose that the battery is discharged at the beginning of the day and has a smart device that indicates when it is convenient to charge from the grid or from the solar panel and discharge energy to the Community.

## 2. Fiber-Optic Cable

The first step in manufacturing fiber-optic glass is to make a solid glass rod, known as a preform. Ultra-pure chemicals -primarily silicon tetrachloride ( SiCl 4 ) and germanium tetrachloride ( GeCl 4 )- are deposited on the inner wall of a silica tube and converted into glass during preform manufacturing. Preforms are later drawn (pulled) into a thin fiber-optic cable. Currently, there is a high demand for fiber-optic cable and there is a bottleneck in the production of preforms due to limited manufacturing capacity.
A company, Tyndall Inc., is planning to build two new factories to produce preforms in two different locations. There are eight candidate locations, shown in Table1 below where the distance between each city pair is shown in kilometers.

|  | City 2 | City 3 | City 4 | City 5 | City 6 | City 7 | City 8 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| City 1 | 1484 | 1037 | 385 | 871 | 1290 | 2489 | 2165 |
| City 2 |  | 1948 | 1095 | 1177 | 391 | 1271 | 2123 |
| City 3 |  |  | 1244 | 862 | 1596 | 2013 | 1216 |
| City 4 |  |  |  | 836 | 908 | 2272 | 2130 |
| City 5 |  |  |  |  | 792 | 1621 | 1299 |
| City 6 |  |  |  |  |  | 1301 | 1734 |
| City 7 |  |  |  |  |  |  | 1616 |

Table1 - Distance in km between candidate locations
To produce the preforms they need supplies of SiCl 4 and GeCl 4 as well as silica tubes. For each unit of preform 1,3 liters of $\mathrm{SiCl} 4,1$ liter of GeCl 4 , and one silica tube are required. The densities of SiCl 4 and GeCl 4 are $1.48 \mathrm{~kg} /$ liter and $1.88 \mathrm{~kg} /$ liter respectively. Each silica tube weighs $4,6 \mathrm{~kg}$. Each preform, once manufactured, weighs 7 kg .
Suppliers of SiCl 4 and GeCl 4 and their annual production in liters can be found in the cities shown below in Table2:

|  | SiCl 4 | GeCl 4 |
| :---: | :---: | :---: |
| City 5 | 150000 | 80000 |
| City 6 | 200000 | 70000 |

Table2 - Supplies in liters of SiCl4 and GeCl4

Suppliers of silica tubes and their annual production in units can be found in the cities shown below in Table3:

|  | Silica tubes |
| :--- | ---: |
| City 1 | 100000 |
| City 3 | 130000 |

Table3 - Supplies in units of silica tubes
Tyndall Inc. wants to supply preform tubes to four locations where these preforms will be drawn to be transformed into fiber-optic cables. These locations and their annual demand for preform tubes are shown in Table4. The company wants to supply the total preform demand for these locations.

|  | Preforms |
| :--- | ---: |
| City 2 | 50000 |
| City 4 | 50000 |
| City 7 | 50000 |
| City 8 | 50000 |

Table4 - Demand in units of preforms
Thus, Tyndall Inc. will have to transport $\mathrm{SiCl} 4, \mathrm{GeCl} 4$, and silica tubes from the locations where these materials are available to the locations where they decide to build the new factories of preforms, and they will have to transport preforms from the new factories to the locations where the preforms are demanded. Each factory can manufacture a different number of preforms, but each factory must receive enough materials ( $\mathrm{SiCl} 4, \mathrm{GeCl} 4$, and silica tubes) to produce its preform output.
Tyndall Inc. estimates that the transport cost, per each ton and each kilometer, is $0.15 € /(\mathrm{t} \cdot \mathrm{km})$
a) Formulate a mixed integer linear program to help Tyndall Inc. decide where to build their two factories to minimize the total transport costs.
b) What would be the solution if they build only one factory to supply all the demand? Compare the results with section a).
c) Modify the model in section a) to include the following condition: City 6 has a strong influence on the central government and forces Tyndall Inc. to buy all its annual supply of SiCl 4 and GeCl4 in case Tyndall Inc. does not build a factory in their city. Compare the results with section a).

## 3. Fire Management

We are the Fire Department responsible for using the available resources to fight a fire recently started in a wooded area. The fire has been identified using the gray cells in this simplified map.

|  | C1 | C2 | C3 | C4 | C5 | C6 | C7 | C8 | C9 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| R1 | Res |  |  |  |  |  |  |  |  |
| R2 |  |  |  |  |  |  |  |  |  |
| R3 |  |  |  | SP |  |  |  | 3 |  |
| R4 |  |  |  |  |  |  | 7 | 9 | 9 |
| R5 |  |  |  |  |  | 3 |  |  |  |
| R6 |  |  |  |  | 5 | 6 |  |  |  |

| R7 |  |  |  | 9 | 8 | 1 |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| R8 |  |  | 6 | 10 | 5 |  |  |  | SP |
| R9 |  |  | 5 | 9 |  |  |  |  |  |

The resources available for fighting the fire are:

- Two hydroplanes that can take water from a close reservoir Res (in blue and located in cell (R1, C1))
- Three helicopters that will take the water from the municipal swimming pools (SP) of two close villages (in blue in the figure, located in (R3, C4) and (R8, C9))
- Five human brigades, each one driving a truck

To organize the firefighting, the following conditions must be met:

- A helicopter can only attack a single cell
- The hydroplane can attack two consecutive cells, but the organization of their flights requires deciding whether to attack horizontally (W-E) or vertically (N-S) for both hydroplanes. No restriction on attacking contiguous rows or columns.
- A human brigade can only attack a single cell
- No helicopter can work in a cell contiguous to the working cells of the hydroplanes in the attack direction.
- At most, two helicopters can take the water from the same swimming pool

The ecological value of the area under fire has been assessed depending on the tree and plant composition and assigned a number depicted in the figure for each cell. The higher the most ecologically valuable the cell.
a) Determine the optimal decisions on deploying the different available resources to maximize the value of the areas attacked by the resources or minimize the lost value of the cells. We are assuming that a cell attacked by any resource will stop the fire and, consequently, has a lost value of zero.
a. Determine the use of each swimming pool by each helicopter.
b) Now, change the objective function to minimize the flight distances of the helicopters and hydroplanes. Distances will be measured as Euclidean ones.
c) Now, determine the best solution to minimize the area lost subject to moving hydroplanes and helicopters the lower the better

## 4. Computer Manufacturing Company

A computer manufacturing company is analyzing the impact of producing computers directly in Europe and the USA to mitigate risk linked to the supply chain. Nowadays, this company only produces computers in China. They are willing to open two new factories, one in Europe and one in the States.
Their catalog includes 1 desktop computer and 2 laptops ( 1 premium and 1 standard). For each computer type, they include 2 memory options (regular, and extra).
The COO would like to understand how production would be allocated if they run this project. To allocate production you should consider that:

1. Premium computers cannot be produced in Europe and desktop computers cannot be produced in America; production capacity is defined in the table below (thousands of units)

|  | USA | Europe | China |
| :---: | :---: | :---: | :---: |
| Desktop | - | 150 | 200 |
| Standard Laptop | 100 | 200 | 200 |
| Premium Laptop | 25 | - | 5 |

2. For each type of computer (desktop, standard, or premium) that is produced in a factory, the company should assume $50 \mathrm{k} €$ costs that are not included in the margin.
3. If the production in a factory is less than $90 \%$ of its maximum capacity, it has a negative impact of $50 \mathrm{k} €$ on the company's profit
4. If the same factory produces both desktops and laptops, they have 100 k $€$ extra costs in that factory.
5. Expected minimum and maximum demand for each type of computer are shown in the table below (thousands of units).

|  | Desktop <br> Regular | Desktop <br> Extra | Standard <br> Regular | Standard <br> Extra | Premium <br> Regular | Premium <br> Extra |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Minimum | 100 | 150 | 75 | 100 | 2 | 2 |
| Maximum | 300 | 350 | 250 | 250 | 30 | 10 |

6. Expected margin for each type of computer is shown in the table below.

|  | Desktop <br> Regular | Desktop <br> Extra | Standard <br> Regular | Standard <br> Extra | Premium <br> Regular | Premium <br> Extra |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Margin | 5 | 4 | 5 | 6 | 20 | 30 |

Questions:
A) What is the expected production in each factory that maximizes profit?
B) In Europe, employees have requested an extra bonus related to production. Basically, they propose that if the European factory reaches $80 \%$ of capacity, the company must pay a bonus. The bonus has an estimated cost of $100 \mathrm{k} €$. How would this condition production?
C) The COO has fixed that the production of each type of computer (desktop, standard, or premium) should represent at least $20 \%$ of the total capacity of each factory. How does it condition the production? (To solve this section, you should include the employee bonus described in section $B$ )

## 5. Movie Shoot

The very well-known American media company Metro-Óscar-Mayer (MOM for short) will start its next production in Spain. But as COVID has depleted the company's coffers, instead of going to big cities they are looking for villages and small towns. You, as the Operations Research Scientist behind the company, are planning the scheduling of scenes given that each scene is shot in a specific location and needs a particular subset of actor/actresses.
You can see in the following table a matrix with tuples of costs in the form of <number of moving days, fixed cost in $k €>$ of moving from one location to another one:

|  | Malcocinado | Guarromán | Casasbuenas | O Quinto Pino | Guasa |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Malcocinado | $(0,0)$ | $(1,9)$ | $(1,7)$ | $(3,12)$ | $(3,13)$ |
| Guarromán | $(1,9)$ | $(0,0)$ | $(1,4)$ | $(3,10)$ | $(3,11)$ |
| Casasbuenas | $(1,7)$ | $(1,4)$ | $(0,0)$ | $(2,8)$ | $(2,6)$ |
| O Quinto Pino | $(3,12)$ | $(3,10)$ | $(2,8)$ | $(0,0)$ | $(3,15)$ |

20/09/2022

| Guasa | $(3,13)$ | $(3,11)$ | $(2,6)$ | $(3,15)$ | $(0,0)$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

$\left(^{*}\right)$ Just to be clearer: if we go from Malcocinado to Guarromán it will take us 1 moving day and $9 \mathrm{k} €$, while moving from Casasbuenas to $O$ Quinto Pino will take us 2 moving days and $8 \mathrm{k} €$.
Having said that, a movie consists of a set of scenes, and each scene takes place for a determined duration in a given location with a set of actors/actresses. The order of shooting is not influenced by the order in the final version of the movie, but by economic reasons related to costs of actresses/actors and locations. Each actor/actress has a daily cost given in the following table, as well as a set of scenes in which they appear:

|  | Angelina <br> Cruz | Morgan <br> Dicaprio | Charlize <br> Pataki | Matthew <br> Schwarzenegger | Thandie <br> Hathaway | Brendan <br> Cruise |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Cost in <br> k€ | 8 | 2 | 9 | 9 | 20 | 17 |
| Scenes | $1,7,8,9$ | $3,5,6,7,8,9$ | $1,3,4,5,6,9$ | $3,6,7,8$ | $1,4,5,6,7,8$ | $1,2,3,4,5,6,7,8,10$ |

Each scene is shot in a different location given in the following table, and has a specific duration given in number of days needed for the shot:

| Scene | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Location | Guasa | Malcocinado | O Quinto Pino | Guasa | Guasa | Malcocinado | Malcocinado | Casasbuenas | Guarromán | O Quinto Pino |
| Duration (da) | 5 | 4 | 2 | 2 | 4 | 5 | 1 | 5 | 5 |  |

There are also precedence constraints between some scenes:

- Scene 9 needs to be shot before scene 10.
- Scene 1 needs to be shot before scene 7 .
- Scene 6 needs to be shot before scene 4 .

Therefore, the problem consists in finding the optimal sequence of scenes that satisfies the precedence constraints and minimizes the following costs:

- The cost of changing the location. Every time we need to move all the sets from one location to another one, we need to pay a fixed cost given in the first table.
- The cost of an actress/actor. You can consider that:
- For every scene they play, they get paid every day of the scene. So, if the scene takes 5 days, they get paid for those 5 days.
- They must be present for their scenes and must stay on the set in between. Even when not playing, the actor/actress is paid for these extra days of presence (days of moving from one location to another one plus the days of the scenes they do not play in between their scheduled scenes). This is the real actress/actor cost since they do not have to be on the set until their first scheduled scene and they can leave the set after their last scheduled scene.

## 6. Music Festivals

COVID is ending and music lovers are eager to attend to music festivals again. You, as responsible of an entertainment company, are planning the organization of four festivals in four cities: Madrid, Badajoz, Las Palmas, and Sevilla. The traveling cost, in hours, between cities is shown in the following table:

|  | Madrid | Badajoz | Las Palmas | Sevilla |
| :--- | :---: | :---: | :---: | :---: |
| Madrid | 1 | 4 | 3.5 | 3.5 |
| Badajoz | 3.5 | 0.2 | 7 | 2 |

| Las Palmas | 3 | 7 | 0.7 | 3 |
| :--- | :---: | :---: | :---: | :---: |
| Sevilla | 3 | 2.5 | 3.5 | 1 |

$\left({ }^{*}\right)$ Note that traffic may increase traveling time. For example, Madrid to Badajoz takes 4 hours, while Badajoz to Madrid takes 3.5 hours. Spending the night in the same city has a cost too.
Each festival will last one day. You know the sequence of festivals will happen from June 11 to June 14, but you have not decided on the location for each date. The number of groups or musicians that will participate in each festival is 5 in Madrid, 2 in Badajoz, 4 in Las Palmas, and 3 in Sevilla. You have already pre-arranged the venues and know that the maximum capacity of each is 50,000 in Madrid, 7,000 in Badajoz, 13,000 in Las Palmas, and 31,000 in Sevilla. The profit per ticket amounts to $25 €$ in Madrid, $20 €$ in Badajoz, $30 €$ in Las Palmas, and $25 €$ in Sevilla.
The potential cast of groups and musicians include Rui Diaz, Red Chilies, CT, Rossa, DAOS, Fighters, Bizz, and Paul Alba. The preliminary conversations oblige to accommodate each group or musician, at least, in one festival. The following table shows the attractiveness (i.e., what percentage of attendants will purchase a ticket), the hiring cost per participant, the traveling cost per equivalent hour of the trip, and where they are located before starting the tour:

|  | Attractiveness <br> $[\%]$ | Hiring cost $[€]$ | Traveling cost $[€ / \mathrm{h}]$ | City |
| :--- | :---: | :---: | :---: | :---: |
| Rui Diaz | 10 | 10,000 | 500 | Badajoz |
| Red Chilies | 40 | 100,000 | 3,000 | Madrid |
| CT | 50 | 80,000 | 2,000 | Sevilla |
| Rossa | 70 | 150,000 | 4,000 | Sevilla |
| DAOS | 30 | 80,000 | 2,500 | Madrid |
| Fighters | 40 | 120,000 | 3,500 | Madrid |
| Bizz | 20 | 30,000 | 500 | Las Palmas |
| Paul Alba | 20 | 50,000 | 800 | Sevilla |

You also receive a report from the marketing department with the following information:

- CT and Rossa are incompatible with DAOS.
- Rui Diaz and Paul Alba playing together can attract an additional 30\%.
- People without ticket cause a reputational loss of $5 €$ per unavailable ticket.
- All artists must finish their tour in the departing city.

Your duty is to decide the location and lineup for each date that maximizes the profit.
HINT: formulate first the problem, and then establish the boundary conditions-the starting and finishing cities of the tour.
