

LE: Developing web-based applications Lab 05: PHP II

- 1) Write a function add, to calculate the addition of two numbers. The user has to introduce the numbers by means of a form, and the result has to be displayed on the screen.
- 2) Given the following array

```
$EU = array( "Italy"=>"Rome", "Luxembourg"=>"Luxembourg",  
"Belgium"=> "Brussels", "Denmark"=>"Copenhagen",  
"Finland"=>"Helsinki", "France" => "Paris",  
"Slovakia"=>"Bratislava", "Slovenia"=>"Ljubljana",  
"Germany" => "Berlin", "Greece" => "Athens",  
"Ireland"=>"Dublin", "Netherlands"=>"Amsterdam");
```

Write a Php program to display a country along with its capital within the same row of a table.

(to run the array: `foreach($EU as $country => $capital)`)

- 3) Given the following form, write a Php program which will receive a string and the option selected by the user, and will perform an action in base to the selected option.

Introduce una cadena:

Concatenar con:

Buscar:

Dividir por el carácter:

Reemplazar:
