

### 1 Create a simple AJAX application

Check the web service by calling:

<http://www.iit.upcomillas.es/palacios/cursoAppWeb/areas.php?area=13>

Use NVU (or Kompozer) editor to create the main page that contains a small form to read the name of the area and an empty object to display results.

The screenshot shows a web page with a blue header bar containing the text "Area Members". Below the header, there is a form with a label "Area:" followed by a dropdown menu showing "ASI" and a downward arrow. Below the dropdown menu, there is a label "List of Members:" followed by a large empty rectangular box intended for displaying the results.

Copy the JavaScript function from the slides

Test your application. NOTE: There is no need to use EasyPHP for this part.

### 2 Create your own web service (optional)

Create a database using MySQL Admin

Create a web service (PHP program) to query your database.

Change the HTML code from exercise 1 to call your web service (located at localhost) instead of calling areas.php
